

DAY - 6 SUMMARY

Control Structure and Looping Statements

Definition

Control structures are statements used to control the flow of execution in a program. They help in decision-making and repeating tasks.

IF Statement :

The if statement is used to execute a block of code when a condition is true.

Syntax

```
if(condition)
{
    // statements
}
```

IF-ELSE Statement :

The if-else statement is used to execute one block of code if the condition is true and another block if the condition is false.

Syntax

```
if(condition)
{
    // statements
}
else
{
    // statements
}
```

ELSE-IF Ladder :

The else-if ladder is used to check multiple conditions one after another.

Syntax

```
if(condition1)
{
    // statements
}
else if(condition2)
{
    // statements
}
```

```
    // statements
}
else
{
    // statements
}
```

SWITCH-CASE Statement :

The switch-case statement is used to select one block of code from multiple choices.

Syntax

```
switch(variable)
{
    case value1:
        // statements
        break;

    case value2:
        // statements
        break;

    default:
        // statements
}
```
